

Machine Learning Basics

Machine learning is a branch of artificial intelligence. It allows computers to learn patterns from data and make predictions or decisions without being explicitly programmed.

There are three common types of machine learning:

1. Supervised learning
2. Unsupervised learning
3. Reinforcement learning

Supervised learning uses labeled data to train a model. Examples include classification and regression.

Unsupervised learning works with unlabeled data. Clustering is a common example.

Reinforcement learning allows an agent to learn by interacting with an environment and receiving rewards.

Python is widely used for machine learning.
